ABSTRACT

Bicyclic heteroaryl compounds of formula (I) shown below are disclosed. Each variable in formula (I) is defined in the specification. Also disclosed is treatment of cancer with these compounds.

CROSS REFERENCE TO RELATED APPLICATION

[0001] This application is a continuation-in-part and claims priority to U.S. patent application Ser. No. 11/949,070, filed Dec. 3, 2007, which in turn claims priority to U.S. Provisional Application Ser. No. 60/873,041, filed Dec. 5, 2006. The contents of these two applications are incorporated herein in its entirety.

BACKGROUND

[0002] Lymphangiogenesis is the formation of lymphatic vessels from pre-existing lymphatic vessels. It plays an important role in promoting neoplasm metastasis. It has been found that vascular endothelial growth factor receptor-3 (VEGFR-3) mediates lymphangiogenesis in response to its two ligands, VEGF-C and VEGF-D. Thus, it is desirable to develop novel drugs that inhibit the VEGFR-3/ligand signaling pathway for cancer treatment.

SUMMARY

[0003] This invention is based on the discovery that certain bicyclic heteroaryl compounds are effective in reducing metastasis and treating cancer by inhibiting VEGFR-3 activities.

[0004] In one aspect, this invention features bicyclic heteroaryl compounds of formula (1):

\[
\begin{align*}
\text{(1)} & \\
& \text{in which } Y \text{ is } O, \text{ S, } \text{Se, or } NR_1, \text{ R}_1 \text{ being } H, \text{ alkyl, alkenyl, cycloalkyl, heterocycloalkyl, aryl, or heteroaryl, } R_3 \text{ is } H, \text{ alkyl, alkenyl, cycloalkyl, heterocycloalkyl, ary, heteroaryl, heterocycloalkyl, aryl, heteroaryl, } \text{SR}_{R_2}, \text{ SeR}_{R_2}, \text{ or } \text{NR}_{R_2}R_{R_3}, \text{ each of } R_1 \text{ and } R_2 \text{ independently being } H, \text{ alkyl, alkenyl, cycloalkyl, heterocycloalkyl, aryl, or heteroaryl. In these compounds, } Y \text{ can be } \text{NR}_{R_1} \text{ and } R_3 \text{ can be } \text{SR}_{R_2}, \text{ SeR}_{R_2}, \text{ or } \text{NR}_{R_2}R_{R_3}, \text{ each of } R_1 \text{ and } R_2 \text{ independently being } H, \text{ alkyl, alkenyl, cycloalkyl, heterocycloalkyl, aryl, or heteroaryl, heterocycloalkyl, aryl, or heteroaryl, heterocycloalkyl, aryl, or heteroaryl, or } \text{R}_4 \text{ or } \text{R}_5 \text{ together with the nitrogen atom to which they are attached form heterocycloalkyl or heteroaryl; } R_6 \text{ is heterocycloalkyl, aryl, or heteroaryl; each of } R_6, R_7, R_8, \text{ and } R_9 \text{ independently, is } H, \text{ alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkenyl, heterocycloalkyl, heterocycloalkenyl, aryl, heteroaryl, halo, CN, NO}_2, \text{ or } OR, \text{ COOR}, \text{ OC(O)R}, \text{ C(O)OR}, \text{ C(O)NR}_{R_1}R_{R_2}, \text{ C(O)NR}_{R_1}NR_{R_2}R_{R_3}, \text{ SO}_{2}NR_{R_1}R_{R_2}, \text{ or } \text{SR}_{R_1}R_{R_2}, \text{ in which each of } R_1, R_2, \text{ and } R_3 \text{ independently is } H, \text{ alkyl, cycloalkyl, heterocycloalkyl, aryl, or heteroaryl, or } \text{R}_4 \text{ or } \text{R}_5 \text{ together with the nitrogen atom to which they are attached form heterocycloalkyl or heteroaryl.}
\end{align*}
\]

[0005] In this formula, each of } X_2, X_3, \text{ and } X_4 \text{ independently is } C, \text{ or } N, \text{ and at least two of } X_2, X_3, \text{ and } X_4 \text{ are each } N; \text{ each of } R_7, \text{ and } R_8 \text{ independently, is } H, \text{ alkyl, alkenyl, cycloalkyl, cycloalkenyl, heterocycloalkyl, heterocycloalkenyl, aryl, heteroaryl, halo, CN, NO}_2, \text{ or } OR, \text{ COOR}, \text{ OC(O)R}, \text{ C(O)OR}, \text{ C(O)NR}_{R_1}R_{R_2}, \text{ C(O)NR}_{R_1}NR_{R_2}R_{R_3}, \text{ SO}_{2}NR_{R_1}R_{R_2}, \text{ or } \text{SR}_{R_1}R_{R_2}, \text{ in which each of } R_1, R_2, \text{ and } R_3 \text{ independently is } H, \text{ alkyl, cycloalkyl, heterocycloalkyl, aryl, or heteroaryl, or } \text{R}_4 \text{ or } \text{R}_5 \text{ together with the nitrogen atom to which they are attached form heterocycloalkyl or heteroaryl.

[0006] Referring to formula (1), a subset of the bicyclic heteroaryl compounds described above are those in which each of } X_2, X_3, \text{ and } X_4 \text{ is } N \text{ and } X_1 \text{ is } C. \text{ In these compounds, } R_5 \text{ can be heterocycloalkenyl or heteroaryl, } R_1 \text{ can be alkyl or cycloalkyl, each of } R_6, R_7, R_8, \text{ and } R_9 \text{ independently, can be } H, \text{ C}_3-C_{10} \text{ alkyl, } \text{NR}_{R_1}R_{R_2}, \text{ COOR}, \text{ C(O)NR}_{R_1}R_{R_2}, \text{ C(O)NR}_{R_1}NR_{R_2}R_{R_3}, \text{ or } \text{R}_5 \text{ independently, can be } H.

[0007] Another subset of the bicyclic heteroaryl compounds of formula (1) described above are those in which each of } X_1, X_2, X_3, \text{ and } X_4 \text{ is } N, \text{ each of } R_5, R_6, \text{ and } R_7 \text{ independently is } H, \text{ and } R_8 \text{ is } \text{C}_3-C_{10} \text{ alkyl, } \text{NR}_{R_1}R_{R_2}, \text{ COOR}, \text{ C(O)NR}_{R_1}R_{R_2}, \text{ C(O)NR}_{R_1}NR_{R_2}R_{R_3}, \text{ or } \text{R}_5 \text{ independently, can be } H.

[0008] Still another subset of the bicyclic heteroaryl compounds of formula (1) described above are those in which each of } X_2, X_3, \text{ and } X_4 \text{ is } N, \text{ each of } R_5, R_6, \text{ and } R_7 \text{ independently is } H, \text{ and } R_8 \text{ is } \text{C}_3-C_{10} \text{ alkyl, } \text{NR}_{R_1}R_{R_2}, \text{ COOR}, \text{ C(O)NR}_{R_1}R_{R_2}, \text{ C(O)NR}_{R_1}NR_{R_2}R_{R_3}, \text{ or } \text{R}_5 \text{ independently, can be } H.

[0009] The term “alkyl” refers to a straight or branched monovalent hydrocarbon containing, unless otherwise stated, 1-20 carbon atoms (e.g., C_2-C_10 or C_3-C_6). Examples of alkyln include, but are not limited to, methyl, ethyl, n-propyl, 1-propyn, n-butyl, 1-butyn, and t-butyl. The term “alkenyl” refers to a straight or branched monovalent hydrocarbon containing 2-20 carbon atoms (e.g., C_2-C_10 or C_2-C_6) and one or more double bonds. Examples of alkynl include, but are not limited to, ethynyl, propynyl, propynene, allyl, and 1,4-butadienyl. The term “alkynyl” refers to a straight or branched monovalent hydrocarbon containing 2-20 carbon atoms (e.g., C_2-C_10) and one or more triple bonds. Examples of alkynl include, but are not limited to, ethynyl, 1-propynyl, 1- and 2-butynyl, and 1-methyl-2-butynyl. The term “alkoxy” refers to an —O—alkyl radical. Examples of alkoxy include, but are not limited to, methoxy, ethoxy, n-propoxy, isopropoxy, n-butoxy, iso-butoxy, sec-butoxy, and tert-butoxy. The term “acyl” refers to an —C(=O)—R radical in which R can be H, alkyl, alkenyl, cycloalkyl, cycloalkenyl, heterocycloalkyl, heterocycloalkenyl, aryl, or heteroaryl. The term “amin” refers to NH_2, alkylamino, or ary1amino. The term “alkylamino” refers to an —NR(R')—alkyl radical in which R can be H, alkyl, alkenyl, cycloalkyl, cycloalkenyl, heterocycloalkyl, heterocycloalkenyl, aryl, or heteroaryl. The terms “amido” and “carbamido” refer to —NRC(=O)R' and —C(O)NR'R' radicals, respectively, in which each of R and R'...
independently, can be H, alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkenyl, heterocycloalkyl, heterocycloalkenyl, aryl, or heteroaryl.

[0010] The term “cycloalkyl” refers to a monovalent saturated hydrocarbon ring system having 3 to 30 carbon atoms (e.g., C₃-C₁₂). Examples of cycloalkyl include, but are not limited to, cyclopentyl, cyclohexyl, cycloheptyl, cyclooctyl, and adamantyl. The term “cycloalkenyl” refers to a monovalent non-aromatic hydrocarbon ring system having 3 to 30 carbons (e.g., C₃-C₁₂) and one or more double bonds. Examples include cyclopentenyl, cyclohexenyl, tetrahydrocyclopentenyl, and cycloheptenyl.

The term “heterocycloalkyl” refers to a monovalent nonaromatic 5-8 membered monocyclic, 8-12 membered bicyclic, or 11-14 membered tricyclic ring system having one or more heteroatoms (such as O, N, S, or Se). Examples of heterocycloalkyl groups include, but are not limited to, pyran, furan, pyridine, indole, benzofuran, and benzothiophene.

[0011] The term “aryl” refers to a monovalent 6-carbon monocyclic, 10-carbon bicyclic, 14-carbon tricyclic aromatic ring system. Examples of aryl groups include, but are not limited to, phenyl (‘Ph’), naphthyl, pyrenyl, anthryl, and phenanthryl. The term “aryl” refers to an -O-aryl. The term “arylamino” refers to an —N(R)-aryl in which R can be H, alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkenyl, heterocycloalkyl, heterocycloalkenyl, aryl, or heteroaryl. The term “heteroaryl” refers to a monovalent aromatic 5-8 membered monocyclic, 8-12 membered bicyclic, or 11-14 membered tricyclic ring system having one or more heteroatoms (such as O, N, S, or Se). Examples of heteroaryl groups include pyridyl, pyrrolyl, furyl, imidazolyl, indazolyl, benzimidazolyl, pyrimidinyl, thiophenyl, oxazolyl, quinolinyl, quinoxalinyl, indolyl, and thiazoaryl.

[0012] Alkyl, alkenyl, alkynyl, cycloalkyl, heterocycloalkyl, cycloalkenyl, heterocycloalkenyl, amino, aryl, and heteroaryl mentioned above include both substituted and unsubstituted moieties. Possible substituents on amino, cycloalkyl, heterocycloalkyl, cycloalkenyl, heterocycloalkenyl, aryl, and heteroaryl include, but are not limited to, C₁-C₁₀ alkyl, C₂-C₁₀ alkenyl, C₂-C₁₀ alkynyl, C₂-C₁₀ cycloalkyl, C₂-C₁₀ cycloalkenyl, C₂-C₁₀ heterocycloalkyl, C₁-C₁₀ alkoxy, aryl, aryloxy, heteroaryl, heteroaryloxy, amino, C₁-C₁₀ alkylamino, arylamino, C₁-C₁₀ alkylamino, arylamino, C₁-C₁₀ alkylsulfonamino, arylsulfonamino, hydroxy, halo, oxo (O=), thio (S=), thio, silyl, C₁-C₁₀ alkylthio, arylthio, C₁-C₁₀ alkylsulfonyl, arylsulfonyl, acylamino, aminothioacyl, amido, mercapto, amido, thioureido, thiocarbonyl, sulfonyl, guanidino, ureido, cyano, nitro, nitros, azido, acyl, thioacyl, acyloxy, carbamido, carbamyl (—C(O)NH₂), carboxyl (—COOH), and carboxyl ester. On the other hand, possible substituents on alkyl, alkenyl, alkynyl, alkyleny, heteroarylkenyl, heterocycloalkenyl, or alkynyl include all of the above-mentioned substituents except C₁-C₁₀ alkyl.

[0013] In another aspect, this invention features a method for treating cancer. The method includes administering to a subject in need thereof an effective amount of one or more bicyclic heteroaryl compounds of formula (I) shown above. An example of cancer that can be treated by the bicyclic heteroaryl compounds of this invention is lung cancer. The term “treating” or “treatment” refers to administering one or more bicyclic heteroaryl compounds to a subject, who has an above-described disease, a symptom of such a disease, or a predisposition toward such a disease, with the purpose to confer a therapeutic effect, e.g., to cure, relieve, alter, affect, ameliorate, or prevent the above-described disease, the symptom of it, or the predisposition toward it.

[0014] In addition, this invention encompasses a pharmaceutical composition that contains at least one of the above-mentioned bicyclic heteroaryl compounds and a pharmaceutically acceptable carrier.

[0015] The bicyclic heteroaryl compounds described above include the compounds themselves, as well as their salts, prodrugs, and solvates, if applicable. A salt, for example, can be formed between an anion and a positively charged group (e.g., amino) on a bicyclic heteroaryl compound. Suitable anions include chloride, bromide, iodide, sulfate, bisulfite, sulfamate, nitrate, phosphate, citrate, methanesulfonate, trifluoroacetate, acetate, malate, tosylate, tartrate, fumarate, sulfate, naphthalenesulfonate, glutamate, glucuronate, lactate, glutarate succinate, and maleate. Likewise, a salt can also be formed between a cation and a negatively charged group (e.g., carboxylate) on a bicyclic heteroaryl compound. Suitable cations include sodium ion, potassium ion, magnesium ion, calcium ion, and an ammonium cation such as tetramethylammonium ion. The bicyclic heteroaryl compounds also include those salts containing quaternary nitrogen atoms. Examples of prodrugs include esters and other pharmaceutically acceptable derivatives, which, upon administration to a subject, are capable of providing active bicyclic heteroaryl compounds. A solvate refers to a complex formed between an active bicyclic heteroaryl compound and a pharmaceutically acceptable solvent. Examples of pharmaceutically acceptable solvents include water, ethanol, isopropanol, ethyl acetate, acetic acid, and ethanolamine.

[0016] Also within the scope of this invention is a composition containing one or more of the bicyclic heteroaryl compounds described above for use in treating cancer, and the use of such a composition for the manufacture of a medicament for the just-mentioned treatment.

[0017] The details of one or more embodiments of the invention are set forth in the description below. Other features, objects, and advantages of the invention will be apparent from the following drawing, detailed description of embodiments, and also from the appended claims.

**BRIEF DESCRIPTION OF DRAWINGS**

[0018] FIG. 1 illustrates the efficacy of certain compounds of this invention in inhibiting tumor growth in mice.

[0019] FIG. 2 illustrates the efficacy of certain compounds of this invention in inhibiting spontaneous metastasis in mice. N.D.: not detected.

[0020] FIG. 3 illustrates the effect of certain compounds of this invention on reducing tumor recurrence in mice. N.D.: not detected.

[0021] FIG. 4 illustrates the effect of certain compounds of this invention on survival rates of mice.

[0022] FIGS. 5A and 5B illustrate the inhibitory effect of Compound 56 on tumor self-seeding.

The bicyclic heteroaryl compounds described above can be prepared by methods well known in the art. Examples 1-186 below provide detailed descriptions of how Compounds 1-186 were actually prepared.

Scheme I shown below illustrates a typical synthetic route for synthesizing certain exemplary bicyclic heteroaryl compounds. R₁ and R₂ in this scheme can be those described in the Summary section above.
Specifically, as shown in Scheme I above, a substituted benzene containing a nitro group and a halo group can first react with a primary amine compound to form a secondary amine compound. This compound can then undergo a ring closure reaction between the nitro group and the secondary amino group to form a bicyclic heteroaryl compound of this invention.

Scheme II

R₁ and R₄, though R₃, in this scheme can be those described in the Summary section above. R₃ can be H, alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkenyl, heterocycloalkyl, heterocycloalkenyl, aryl, or heteroaryl.
A bicyclic heteroaryl compound synthesized above can be purified by a suitable method such as column chromatography, high-pressure liquid chromatography, or recrystallization.

Other bicyclic heteroaryl compounds can be prepared using other suitable starting materials through the above synthetic routes and others known in the art such as those described in Chen et al., *J. Comb. Chem.*, 2009 (11), 1038-1046. The methods described above may also additionally include steps, either before or after the steps described specifically herein, to add or remove suitable protecting groups in order to ultimately allow synthesis of the bicyclic heteroaryl compounds. In addition, various synthetic steps may be performed in an alternate sequence or order to give the desired compounds. Synthetic chemistry transformations and protecting group methodologies (protection and deprotection) useful in synthesizing applicable bicyclic heteroaryl compounds are known in the art and include, for example, those described in R. Larock, *Comprehensive Organic Transformations*, VCH Publishers (1989); T. W. Greene and P. G. M. Wuts, *Protective Groups in Organic Synthesis*, 2nd Ed., John Wiley and Sons (1991); L. Fieser and M. Fieser, *Fieser and Fieser’s Reagents for Organic Synthesis*, John Wiley and Sons (1994); and L. Paquette, ed., *Encyclopedia of Reagents for Organic Synthesis*, John Wiley and Sons (1995) and subsequent editions thereof.

The bicyclic heteroaryl compounds mentioned herein may contain a non-aromatic double bond and one or more asymmetric centers. Thus, they can occur as racemates and racemic mixtures, single enantiomers, individual diastereomers, diastereomeric mixtures, and cis- or trans-isomeric forms. All such isomeric forms are contemplated.

Also within the scope of this invention is a pharmaceutical composition containing at least one bicyclic heteroaryl compound described above and a pharmaceutical acceptable carrier. Further, this invention covers a method of administering an effective amount of one or more of the bicyclic heteroaryl compounds to a patient having cancer. “An effective amount” refers to the amount of an active bicyclic heteroaryl compound that is required to confer a therapeutic effect on the treated subject. Effective doses will vary, as recognized by those skilled in the art, depending on the types of diseases treated, route of administration, excipient usage, and the possibility of co-usage with other therapeutic treatment. For example, a daily dose of 5 mg/kg of compound 1 can be used to reduce metastasis and a daily dose of 50 mg/kg can be used to inhibit tumor growth.

To practice the method of the present invention, a composition having one or more bicyclic heteroaryl compounds can be administered parenterally, orally, nasally, rectally, topically, or buccally. The term “parenteral” as used herein refers to subcutaneous, intracutaneous, intravenous, intramuscular, intraarticular, intramuscular, intrasynovial, intratinal, intrathecal, intraleisional, or intracranial injection, as well as any suitable infusion technique.

A sterile injectable composition can be a solution or suspension in a non-toxic parenterally acceptable diluent or solvent, such as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that can be employed are mannitol, water, Ringer’s solution, and isotonic sodium chloride solution. In addition, fixed oils are conventionally employed as a solvent or suspending medium (e.g., synthetic mono- or diglycerides). Fatty acid, such as oleic acid and its glyceride derivatives are useful in the preparation of injectables, as are natural pharmaceutically acceptable oils, such as olive oil or castor oil, especially in their polyoxyethylated versions. These oil solutions or suspensions can also contain a long chain alcohol diluent or dispersant, carboxymethyl cellulose, or similar dispersing agents. Other commonly used surfactants such as Tweens or Spans or other similar emulsifying agents or bioavailability enhancers which are commonly used in the manufacture of pharmaceutically acceptable solid, liquid, or other dosage forms can also be used for the purpose of formulation.

A composition for oral administration can be any orally acceptable dosage form including capsules, tablets, emulsions and aqueous suspensions, dispersions, and solutions. In the case of tablets, commonly used carriers include lactose and corn starch. Lubricating agents, such as magnesium stearate, are also typically added. For oral administration in a capsule form, useful diluents include lactose and dried corn starch. When aqueous suspensions or emulsions are administered orally, the active ingredient can be suspended or dissolved in an oily phase combined with emulsifying or suspending agents. If desired, certain sweetening, flavoring, or coloring agents can be added.

A nasal aerosol or inhalation composition can be prepared according to techniques well known in the art of pharmaceutical formulation. For example, such a composition can be prepared as a solution in saline, employing benzyl alcohol or other suitable preservatives, absorption promoters to enhance bioavailability, fluorocarbons, and/or other solubilizing or dispersing agents known in the art.

A composition having one or more active bicyclic heteroaryl compounds can also be administered in the form of suppositories for rectal administration.

The carrier in the pharmaceutical composition must be “acceptable” in the sense that it is compatible with the active ingredient of the composition (and preferably, capable of stabilizing the active ingredient) and not deleterious to the subject to be treated. One or more solubilizing agents can be utilized as pharmaceutical excipients for delivery of an active bicyclic heteroaryl compound. Examples of other carriers
include colloidal silicon oxide, magnesium stearate, cellulose, sodium lauryl sulfate, and D&C Yellow # 10.

The bicyclic heteroaryl compounds described above can be preliminarily screened for their efficacy in treating above-described diseases by in vitro and in vivo assays (see Examples 186 and 187 below) and then confirmed by clinical trials. Other methods will also be apparent to those of ordinary skill in the art.

The specific examples below are to be construed as merely illustrative, and not limiting the remainder of the disclosure in any way whatsoever. Without further elaboration, it is believed that one skilled in the art can, based on the description herein, utilize the present invention to its fullest extent.

EXAMPLE 1
Preparation of Compound 1: methyl 2-(3,3-diphenylpropyl)-2H-indazole-6-carboxylate

\[
\text{MeOH} + \text{HO} \quad \text{O} \quad \text{DCM, } \text{DCC, DMAP} \\
\text{DCM, } \text{n, 6 Hr}
\]

[0040]

\[
\begin{align*}
\text{MeOH} & + \text{HO} \\
\text{O} & \quad \downarrow \\
\text{DCM, DCC, DMAP} & \quad \text{DCM, n, 6 Hr}
\end{align*}
\]

[0041] A solution of dicyclohexylcarbodiimide (DCC, 0.95 g, 4.61 mmol, 1.2 equiv) in 10 mL of dichloromethane (DCM) was added dropwise to a stirred mixture of 4-bromo-3-methyl-3-nitro-benzoic acid 1 (1.0 g, 3.84 mmol, 1.0 equiv) and 4-dimethylaminomethyl pyridine (DMAP) (0.020 g, 0.19 mmol, 0.05 equiv) in 10 mL of dichloromethane-methanol (10%) at room temperature. The mixture was stirred for 6 hours to obtain 4-bromomethyl-3-nitro-benzoic acid methyl ester 2. Dicyclohexyl urea (DCU) thus obtained was removed by filtration and the solvent in the filtered solution was removed under vacuum. The residue was purified by column chromatography using hexane-ethyl acetate (15%) as an eluant to give ester 2 as a light yellow oil.

[0042] To a solution of ester 2 (0.91 g, 3.32 mmol, 1.0 equiv) in 10 mL of dichloromethane was added dropwise 3,3-diphenyl-propylamine (1.40 g, 6.64 mmol, 2.0 equiv). The mixture was stirred at room temperature for 8 hours. After the amine salt thus obtained was removed by filtration, the solvent in the filtered solution was removed under vacuum to give crude 4-[(3,3-diphenyl-propylamino)-methyl]-3-nitro-benzoic acid methyl ester 3. The crude product was purified by column chromatography using hexane-ethyl acetate (25%) to give ester 3 as a light brown oil.

[0043] 4-[(3,3-diphenyl-propylamino)-methyl]-3-nitro-benzoic acid methyl ester 3 (0.81 g, 3.21 mmol) was dissolved in 10 mL of methanol and treated with ammonium formate (1.26 g, 20.02 mmol, 10 equiv) and palladium on carbon (162 mg, 20%). The mixture was stirred for 1 day at room temperature. After the mixture was then filtered through a small plug of Celite and washed with dichloromethane, the solvent was removed under vacuum to give a crude product.

The crude product was purified by column chromatography using hexane-ethyl acetate (25%) to give compound 1, 243,3-diphenyl-propyl)-2H-indazole-6-carboxylic acid methyl ester, as a white solid.

EXAMPLES 2-55
Preparation of Compounds 2-55

[0047] Compounds 2-55 were prepared in a manner similar to that described in Example 1.

EXAMPLES 56-186
Preparation of Compounds 56-186

[0048] Compounds 56-186 were prepared in a manner similar to that described in Example or that described in Chen et al., J. Comb. Chem., 2009 (11), 1038-1046.

EXAMPLE 187
KIRA-ELISA Assay

[0049] This assay was performed in two microtiter plates. The first plate was used to culture an adherent cell line expressing the VEGF receptor 3 and to stimulate the receptor with a test compound. The second plate was used to capture
the solubilized membrane receptor, which was then probed
for phosphotyrosine content with phosphotyrosine-specific
antibody.

[0050] Specifically, H928 cells (2x10^5) in 100 μl medium
were added to each well in a flat-bottom 24-well culture plate
and cultured overnight at 37°C in 5% CO2. After the super-
natants were removed, the cells were serum-starved for 24
hours. A medium containing a test compound was added into
each well and the cell culture was incubated for 30 minutes
before it was stimulated by recombinant VEGF-C for 15
minutes. After the supernatants were removed, 100 μl of a
lysis buffer were added into each well to lyse the cells and
solubilize the VEGFR3. The lysis buffer included 150 mM
NaCl containing 50 mM Hepes (Genentech media prep),
0.5% Triton-X 100 (Genentech media prep), 0.01% thime-
sol, 30 μg/ml aprotinin (ICN Biochemicals, Aurora, Ohio),
1 mM 4(2-aminoethyl) benzenesulfonyl fluoride hydrochlo-
ride (AEBFS; ICN Biochemicals), and 2 mM sodium ortho-
vanadate. The plate was then put on a plate shaker (Belleco
Instruments Vineland, N.J.) and the substance in each well
of the plate underwent mixing for 60 minutes at room tempera-
ture. While the cells were being solubilized, an ELISA micro-
titer plate (Nunc MaxiSorp, Inter Med, Denmark) coated
overnight at 4°C with the affinity-purified polyclonal anti-
VEGFR 3 (2.5 μg/ml in phosphate buffered saline (PBS), 100
μl/well) were decanted, tamped on a paper towel, and blocked
with 150 μl/well block buffer (PBS containing 0.5% BSA and
0.01% thimerosal) for 60 minutes at room temperature with
gentle agitation. The anti-VEGFR 3-coated plate was sub-
sequently washed twice with a wash buffer (PBS containing
0.05% Tween 20 and 0.01% thimerosal). The lysate contain-
ing solubilized VEGFR 3 from the cell-culture microtiter well
were transferred (85 μl/well) to the anti-VEGFR 3-coated
ELISA plate and incubated for 2 hours at room temperature
with gentle agitation. The unbound receptors were removed
by washing with a wash buffer. 100 μl of biotinylated 4G10
(antiphosphotyrosine) diluted to 0.2 μg/ml in dilution buffer
(PBS containing 0.5% BSA, 0.05% Tween 20, 5 mM EDTA,
and 0.01% thimerosal) were added into each well. After
incubation for 2 hours at room temperature, the plate were
washed and 100 μl HRP-conjugated streptavidin (Zymed Labo-
ratories, San Francisco, Calif.) diluted 1:2000 in dilution
buffer will be further added. After the free avidin conjugate
were washed away, 100 μl freshly prepared substrate solution
tetramethyl benzidine, (TMB) was added to each well. The
reaction was allowed to proceed for 10 minutes and the color
development was stopped by the addition of 100 μl/well 1.0
M H2PO4. The absorbance at 450 nm and the absorbance at a
reference wavelength of 650 nm (A_450-A_650) were measured
using an ELISA reader.

[0051] The inhibition efficacy of each test compound is
expressed as an inhibition percentage calculated according
to the following formula: 1-(C-(A)/(B-A)). In this formula, A is
the basal amount of phosphotyrosine detected in a blank
control, B is the amount of phosphotyrosine detected with
VEGF-C only, and C is the amount of phosphotyrosine
detected with a test compound and VEGF-C.

[0052] Among the 186 compounds already synthesized, 118
compounds (i.e., compounds 1-22, 24-30, 32, 34-39, 41-50, 52-122, and 186) were tested. Unexpectedly, Com-
pound 2, at concentration of 1 μM, showed an inhibition
percentage of about 65%. 56 compounds, 57-58, 60-61,
66-68, 70, 72-77, 79-80, 82, 86, 88, 90, 93-96, 98-99, 102-
103, 105-108, 110-112, 115, 120, and 186 each showed sub-
stantially the same inhibition percentage as Compound 2; and
Compounds 11, 56, 59, 62, 64-65, 81, 83-85, 87, 89, 91, 100,
113-114, 117, 119, and 121 each showed an even higher
inhibition percentage than Compound 2.

EXAMPLE 188

In vivo Assay on Tumor Growth Inhibition

[0053] Compounds were tested for their efficacy in inhib-
iting tumor growth on murine xenografts.

[0054] Murine 4T1 breast cancer cells (purchased from the
American Type Culture

[0055] Collection) were cultured to sub-confluence in RPMI
medium supplemented with 10% fetal bovine serum (GIBCO Invitrogen Corp.) at 37°C, 90% humidity and 5% CO2.
The 4T1 cells were established by stable transfection of the firefly luciferase gene (pGL3-control, Promega Corporation) to 4T1 cells using LipofectAMINE PLUS
Reagent (Life Technologies, Inc., Grand Island, N.Y.) for
quantitative assessment of tumor burden in visceral organs.

pcDNA3 vector (Invitrogen Co., Carlsbad, Calif) was
cotransfected for the selection by G418 (Sigma). The result-
ing 4T1 cells were isolated and cultured independently and
the best expressing lines were identified based on the
level of bioluminescent activity in the presence of luciferin in living cells. Highly bioluminescent clone was
selected for further studies.

[0056] Next, 4T1Luc+ cells were orthotopically implanted
into the right inguinal mammary fat pads of 6 to 8-week old
female BALB/c mice (1x10^3 cells in 100 μl PBS/mouse).
After 14 days of tumor cell implantation, a single dose of 50
mg/kg body weight of a test compound or vehicle was admin-
istered intraperitoneally once daily.

[0057] The length (i.e., the biggest diameter) and width
(i.e., the smallest diameter) of the tumor was measured every
3.5 days by using a Vernier caliper. The tumor volume was
then calculated as follows: volume=AxBxH/2, where A is
the length of the tumor and B is the width of the tumor.

[0058] Compounds 2, 56, and 91 (i.e., the acid form of
Compound 56, denoted as 56-A in Fig. 1) were tested. Sor-
afenib ( Nexavar®) and sunitinib (Sutent®), two commercial
anti-cancer drugs, were used as reference compounds.

Unexpectedly, Compound 56 (denoted as 56-E) inhibited tumor
growth almost as effectively as Sutent and Sorafenib, as
shown in Fig. 1. Also unexpectedly, mice treated with Com-
pound 56 showed a higher survival rate than those treated
with Sorafenib.

EXAMPLE 189

In vivo Assay on Inhibiting Spontaneous Metastasis

[0059] To investigate the effect of test compounds on dis-
tant spontaneous metastasis generated by the tumor cells,
4T1Luc+ cells obtained by the method described in Example
188 were implanted into the right inguinal mammary fat pads
of 6-week old BALB/c mice (1x10^3 cells in 100 μl PBS/
mouse). After 14 days of tumor cell implantation, a single
doze of 50 mg/kg body weight of a test compound or vehicle
was administered intraperitoneally once daily. Compounds 2,
56, and 91 were used in this assay. Sorafenib ( Nexavar®) and
sunitinib (Sutent®) were also used as reference compounds.

[0060] A total of 36 mice, six for each of the six groups (i.e.,
5 groups treated with test compounds and 1 vehicle group),
were imaged once weekly for a period of 6 weeks after tumor cell implantation via bioluminescence imaging.

[0061] In vivo bioluminescence imaging was conducted on a cryogenically cooled IVISTM system (Xenogen Corp., Alameda, Calif.) coupled to a data-acquisition PC running Living Image version 3.1 software (Xenogen Corp.). Before imaging, animals were anesthetized in a plastic chamber filled with 2% isoflurane/air mixture and 150 mg/mL of luciferin (potassium salt, Xenogen Corp.) and normal saline was injected i.p. into each mouse at a dose of 150 mg/kg body weight. This dose and route of administration has been previously shown to be optimal for studies in rodents when images were acquired between 10 and 20 minutes post-luciferin administration (Contag C H et al. 1997 Photochem Photobiol.; 66:523-531). During image acquisition, isoflurane anesthesia was maintained using a nose cone delivery system and animal body temperature was regulated using a digitally thermostated bed integrated within the IVISTM system (Xenogen Corp., Alameda, Calif.). A gray scale body surface image was collected in the chamber under dim illumination, followed by acquisition and overlay of the pseudocolor image representing the spatial distribution of detected photon counts emerging from active luciferase within the animal. An integration time of 1 minute was used for luminescence image acquisition.

[0062] The average of the in vivo bioluminescence intensities measured on the 14th day post tumor cell implantation but before treatment with test compounds served as a baseline, corresponding to the metastatic tumor burden of the vehicle group, as shown in FIG. 2.

[0063] Unexpectedly, at the end of the fourth week after compound treatment (i.e., the sixth week after tumor cell implantation), the groups administered with Compound 2 (denoted as “Comp 2” in FIG. 2) and Compound 91 (denoted as “56-A”) exhibited significant lower luminescent signal intensity as compared with the vehicle group while the group treated with Compound 56 (denoted as “56-E”) did not exhibit any detectable luminescent signal. See FIG. 2.

[0064] The observation indicates that Compounds 2, 56, and 91 are unexpectedly comparable or superior to the commercial drugs such as Sorafenib (Nexavar®) and sunitinib (Sutent®) on the inhibition of the spontaneous metastasis generated by the tumor cells.

EXAMPLE 190

Effects on Tumor Recurrence and Survival Rate

[0065] 4T1Luc cells obtained by the method described in Example 188 were implanted into the right inguinal mammary fat pads of 6 to 8-week old female BALB/c mice (1×10⁵ cells in 100 µL PBS/mouse). After 14 days of tumor cell implantation, a single dose of 50 mg/kg body weight of a test compound or vehicle (PBS) was administered intraperitoneally once daily for three weeks. Compounds 2, 56, and 91 were tested in this assay. Sorafenib (Nexavar®) and sunitinib (Sutent®) were also used as reference compounds.

[0066] At the end of three-week treatment, the orthotopically grown tumors were surgically removed from the six groups of mice (i.e., 5 groups each treated with a test compound and 1 vehicle group). Then each of the six groups (i.e., 5 groups each treated with a test compound and 1 vehicle group) were divided into two subgroups, one with no further drug treatment (denoted as “stop treatment” in FIG. 3) and the other with continued drug treatment for 35 days (denoted as the “sustain treatment” in FIG. 3).

[0067] Bioluminescent data were collected in a manner similar to that described in Example 189 above at the end of day 35 after tumor resection.

[0068] Unexpectedly, as showed in the FIG. 3, the groups administered with Compound 2 (denoted as “Comp 2” in FIG. 3), Compound 56 (denoted as “56-E”), and Compound 91 (denoted as “56-A”) after tumor resection all exhibited lower luminescent signal intensity as compared with the corresponding group without continuous treatment. This observation indicates that these compounds decrease the chance of tumor recurrence.

[0069] In addition, Compound 56 reduced tumor recurrence to a degree comparable to that of sunitinib (Sutent®).

[0070] Also unexpectedly, as indicated by the survival curves in FIG. 4, Compounds 2, 56, and 91 increased the overall survival life span of the treated mice as compared with those in the vehicle group. In addition, the “sustain treatment” subgroup of each treated group exhibited a higher survival rate than the “stop treatment” subgroup.

EXAMPLE 191

Effects on Tumor Self-Seeding

[0071] Unlabeled parental 4T1 cells were implanted into a mammary gland of 6 to 8-week old female BALB/c mice (1×10⁵ cells in 100 µL PBS/mouse). After 14 days of tumor cell implantation, a single dose of 50 mg/kg body weight of a test compound or vehicle (PBS) was administered orally once daily for 2 days. Compound 56 was tested in this assay. Sunitinib (Sutent®) was used as a reference compound. Then 4T1Luc cells (1×10⁵ cells in 100 µL PBS/mouse) were injected into the circulatory system of the mice by intracardiac injection. The mice were then administered orally with a single dose of 50 mg/kg body weight of a test compound or vehicle (PBS) once daily for 2 days.

[0072] Bioluminescent data were collected in a manner similar to that described in Example 189 above.

[0073] Unexpectedly, as shown in FIGS. 5A and 5B, the mice treated with Compound 56 (denoted as “56-E”) and Sutent exhibited much weaker bioluminescence than the thoracic cavity at day 7 post the second 2-day drug treatment as well as much weaker bioluminescence form the abdominal cavity at day 14 post the second 2-day drug treatment as compared with the vehicle group. Even more surprisingly, the mice treated with Compound 56 (denoted as “56-E”) exhibited weaker bioluminescence form the abdominal cavity at day 14 post the second 2-day drug treatment as compared with the the Sutent-treated group. These observations indicate that Compound 56 exhibited comparable or even superior ability in inhibiting tumor self-seeding to that of Sutent.

OTHER EMBODIMENTS

[0074] All of the features disclosed in this specification may be combined in any combination. Each feature disclosed in this specification may be replaced by an alternative feature serving the same, equivalent, or similar purpose. Thus, unless expressly stated otherwise, each feature disclosed is only an example of a generic series of equivalent or similar features.

[0075] From the above description, one skilled in the art can easily ascertain the essential characteristics of the present invention, and without departing from the spirit and scope thereof, can make various changes and modifications of the
3. The compound of claim 2, wherein R₂ is heterocycloalkynyl or heteroaryl.
4. The compound of claim 3, wherein R₁ is alkyl or cycloalkyl.
5. The compound of claim 4, wherein each of R₆, R₇, R₈, and R₉, independently, is H, C₁₋₅ alkyl, NR₆R₇, COOR₈, C(O)NR₆R₇, C(O)(N(R₉))(N(R₆)), OCOOR₈, COOR₈, COO(C₆H₄)(COO), C(O)(N(R₆))(N(R₇))(O)(R₅), or heteroaryl.
6. The compound of claim 5, wherein R₆ is COOR₈ and each of R₇, R₈, and R₉, independently, is H.
7. The compound of claim 6, wherein the compound is one of Compounds 2, 25-28, 49, 52, and 53.
8. The compound of claim 2, wherein R₃ is benzimidazol-4-yl, dihydrobenzimidazol-4-yl, indazol-6-yl, or phenyl.
9. The compound of claim 8, wherein R₅ is alkyl or cycloalkyl.
10. The compound of claim 9, wherein each of R₆, R₇, R₈, and R₉, independently, is H, C₁₋₅ alkyl, NR₆R₇, COOR₈, C(O)NR₆R₇, C(O)(N(R₉))(N(R₆)); COO(C₆H₄)(COO), or heteroaryl.
11. The compound of claim 10, wherein R₆ is COOR₈ and each of R₇, R₈, and R₉, independently, is H.
12. The compound of claim 11, wherein the compound is one of Compounds 56, 59, 62, 64, 65, 81, 83-85, 87, 89, 91, 100, 113, 114, 117, 119, and 121.
13. The compound of claim 8, wherein R₂ is phenyl substituted with amino, amido, or thioether.
14. The compound of claim 13, wherein the compound is one of Compounds 88, 92, 93, 120, 123, and 162.
15. A method for treating cancer, comprising administering to a subject in need thereof an effective amount of a compound of claim 1.
16. A method for treating cancer, comprising administering to a subject in need thereof an effective amount of a compound of claim 3.
17. A method for treating cancer, comprising administering to a subject in need thereof an effective amount of a compound of claim 8.
18. A pharmaceutical composition, comprising a pharmaceutically acceptable carrier and a compound of claim 1.
19. A pharmaceutical composition, comprising a pharmaceutically acceptable carrier and a compound of claim 3.
20. A pharmaceutical composition, comprising a pharmaceutically acceptable carrier and a compound of claim 8.
