training of powerhouse and substation operators
training of network analyser operators
training of customers' service station operators
training of VHF and microwave operators and maintenance crew

Our management training facilities include:
management development
work simplification
revaluation of properties

In Taiwan, the hot-line work has become an essential Part of our normal operation. The success of our hot-line work was mainly due to our intensive hot line training program. We had engaged the expert service of an experienced hot line foreman, Mr. Knudson, from the United States for six months. He trained four of our hot line crews of 12 men each. These crews were later acted as instructors to train other hot line crews.

We also offer to members of this Sub-Committee the exchange of information on Problems of planning, development and financial policies, standardization of methods and procedures.

It is our sincere wish that by establishing a regional training center in Taiwan, our engineers and technicians will have a chance to contact many prominent peoples from other parts of this region and that they will themselves be much enlightened by exchanging views with the visiting engineers and technicians who are going to take part in the training.

In conclusion, we would also offer the facilities of our electronic network analyzer as well as our high tension laboratory to members of this Sub-Committee for board study and/or research work.

REGIONAL TRAINING CENTERS FOR ELECTRIC POWER INDUSTRY
C. F. HSU

On behalf of my Government and in response to the suggestion made by the Secretariat that countries of the region with national institutions for technical training and/or research may like to offer host facilities to other countries of the region. I hereby offer facilities of the Republic of China for training of the "8-man Team" as proposed by the Panel of Experts on Rural Electrification and also for other technical and managerial training for the electric power industry.

Since 1951, we have established a training center at a scenic spot near Taipei in north Taiwan. Besides numerous other training facilities, it has many classrooms, workshops and a dormitory big enough to accommodate 140 trainees at one time. We also have two field training centers. The one in the middle of the island can accommodate 90 trainees and another in the south can accommodate 50.

During the 12 years up to the end of 1962, we have trained a total of 172 classes with more than 6,000 graduates. of these, about 55% was for in-service training and 30% for apprentice training.

Our existing training facilities include:
training of planning and design engineers for generation transmission and distribution
training of construction crews for electrical and mechanical installations and civil works
training of foremen and linemen—including hot-line work
